## Conclusions:

The data set needs to be modeled to include absences for cover. I know how to do this but do not understand how to run statistics for each plot and compare all of them. From the models using the long format, we can see trends that the Red Maples are widespread, and have less enviornmental factors that effect their distribution. The Fraiser fir is a habitat specialist and elevation, distance from steam, and slope aspect have a signifianct effect on cover. This species is also less widespread with fewer individuals.
